# Efficacy of Bactericides on Pseudomonas syringae on hibiscus 

A. R. Chase

Chase Agricultural Consulting, LLC
937 Tierra Verde Circle
Cottonwood, AZ 86326
928-649-0400
Purpose: Evaluate some new formulations of bactericides for control of bacterial spot (Pseudomonas syringae) on Hibiscus 'Lutea'

Treatments:
A. Noninoculated control

-     -         - 

B. Inoculated control

-     -         - 

C. BotryStop and Capsil

48 oz/100 gal
4 oz/100 gal
D. Cease
E. GWN-10320 and Capsil
F. Triathlon BA 2\% 32 oz/100 gal 6 oz/100 gal
G. Camelot O

2\%
H. Kalmor

2\%
I. exp. 1

32 oz/100 gal
25 oz/100 gal
J. exp. 2

25 oz/100 gal
Twelve plants per treatment were planted from liners into 4 inch pots on September 5. The peat-based potting medium was amended with Osmocote Plus minors 19-6-12.

Inocula of Pseudomonas syringae originally obtained from Hibiscus were started on nutrient agar (5 plates) on 10-13-18.
Intermittent mist ( $2 \mathrm{~min} / 30 \mathrm{~min} 12 \mathrm{hr} /$ day) started on 10-13-18.
Plants were inoculates and covered with polyethylene for 3 days starting on 10-15-18.
Treatments were applied using a pump action hand sprayed to the point of drip three times on approximately a 10-day interval:

| Date | Time | Temperature |
| :--- | :--- | :---: |
| $10-8-18$ | $8: 45-9: 10 \mathrm{am}$ | 65 F |
| $10-19-18$ | $9: 00-9: 15 \mathrm{am}$ | 74 F |
| $10-29-18$ | $8: 45-9: 00 \mathrm{am}$ | 61 F |

The total number spots per plant was recorded on 27 October 2018
Normality Test (Shapiro-Wilk): Failed ( $\mathrm{P}<0.050$ )
Equal Variance Test (Brown-Forsythe): Failed ( $\mathrm{P}<0.050$ )

The differences in the mean values among the treatment groups are greater than would be expected by chance; there is a statistically significant difference ( $\mathrm{P}=0.003$ ).
Power of performed test with alpha $=0.050: 0.832$
All Pairwise Multiple Comparison Procedures (Holm-Sidak method):, Overall significance level $=0.05$

The number leaves with spots per plant was recorded in November 2, 2018.
Normality Test (Shapiro-Wilk): Failed ( $\mathrm{P}<0.050$ )
Equal Variance Test (Brown-Forsythe):Failed(P < 0.050)

Number spots per plant on two dates.
Conclusions:

- The best prevention of Pseudomonas leaf spot in this trial was given by Kalmor closely followed by the biopesticide, BotryStop.
- The biopesticides, GWN-10320, Cease and Triathlon BA were not effective in this trial.
- All other copper products also performed well including Camelot O, and the exp. products.
- None of the products resulted in any phytotoxicity in the trial including possible stunting.
